

INDUSTRIAL RADIOGRAPHIC FILM DIGITISATION

Your radiographic archive. Traceable. Digital. At your project site.

We digitise RT films and associated documentation at your premises, preserving the reference of every image.

THE SERVICE

A digital image adds value when you know which film it came from, which weld it relates to and where its documentation is.

01

Films under control

Inventory, identification and careful handling of originals throughout the digitisation project.

02

References that connect

Links between film, weld, drawing, report and dossier, within the agreed scope.

03

An archive you can use

Images, metadata and a delivery index structured for your project.

A service for organisations that need to turn their RT archives into accessible, structured information.

Location, volume and formats.

Let's start with your archive.

HOW WE WORK

From original film to digital dossier.

A straightforward, controlled process carried out at your project site.

01 Identify

We check identification and the links between each film, weld, drawing and document. Incomplete references are clarified before proceeding.

02 Digitise

We configure acquisition and film masks for each format. Where the equipment and procedure allow, we scan several small films simultaneously.

03 Verify

We review image completeness, readability and identification, together with system stability checks. We document issues and corrections.

04 Deliver

We organise files and the traceability index to meet the client's requirements. We support review and clarification through to completion of the agreed delivery.

We use KOWOSCAN X50 technology to digitise industrial radiographic films with parameters defined for each project.

Digitisation converts and organises the existing radiographic record. A new interpretation of the weld is a separate task requiring its own scope, appropriately qualified personnel and a suitable procedure.
